Thermal buckling and post-buckling of shape memory alloy reinforced composite laminated beam is analyzed. The one-dimensional thermo-mechanical constitutive law of Brinson is utilized to calculate the stress recovery of SMA wires. Considering the geometrical nonlinearity of von-Karman type and the static version of virtual displacements, the nonlinear equilibrium system of equations are ...

The thermal post-buckling load-deflection curves of Si 3 N 4 /SUS304 tubes by adopting different beam theories are presented and compared in Fig. 7, in which w m / R 0 = W m means the dimensionless form of the maximum deflection and the thermal post-buckling response of FGM tubes with length L = 35 R 0 and L = 25 R 0 are compared. From analysis, a conclusion can be drawn that the transverse ...

In this study, behaviour of a thin semicircular arch made of functionally graded material subjected to radial and tangential follower forces, as well as thermal loading, based on the theory of large deformation of the arches and critical buckling load and post-buckling of structures is investigated. Assuming thin arch, governing equations of the arch behaviour are derived using kinematics and ...

In addition, we can observe that the post-buckling thermal deformation calculated by the clamping frame model, is increased as the clamping pressure increases. Again, we can attribute this phenomenon to the various clamping conditions in simulations. A strengthening clamping boundary is involved in the simulation with high clamping pressure, which would suppress the in-plane sliding and ...

The effects h f / h ratio on post-buckling response of bow-in and bow-out shells are depicted in Fig. 3, Fig. 4, Fig. 5, Fig. 6. It can observe that when the h f / h ratio increases the mechanical post-buckling strength of shells rise, in contrast, the thermal post-buckling loading capacity reduces. Fig. 7 and Fig. 8 describes effects of volume fraction index k on post-buckling paths of shells.

Buckling and post-buckling thermomechanical deformations of a functionally graded material (FGM) Timoshenko beam resting on a two-parameter non-linear elastic foundation and subjected to only a temperature rise have been numerically investigated with the shooting method. The material properties are assumed to vary only in the thickness direction according to a power law function. Through-the ...

Buckling and post-buckling responses of rotating clamped-clamped functionally graded microbeams in thermal environment are examined on the basis of the Euler-Bernoulli beam assumption. To enrich the formulation with the size effect the modified couple stress theory is employed. The temperature dependency of material properties is considered.

Buckling is also a failure mode in pavement materials, primarily with concrete, since asphalt is more flexible. Radiant heat from the sun is absorbed in
the road surface, causing it to expand, forcing adjacent pieces to push against each other. If the stress is great enough, the pavement can lift up and crack without warning. Going over a buckled section can be very jarring to automobile...
